3164. A CASE OF ARHINENCEPHALY - Über einen Fall von 'Arhinenzephalie' -
Hadjiev D. and Gancev S. Inst. zur Ausbildung und Spezialisierung
der Ärzte. Neurol. Klin., Sofia - ZBL. ALLG. PATH. PATH. ANAT. 1958,
98/7-8 (379-385) Illus. 4

The syndrome of arhinencephaly, which is well compatible with life, in its classical form consists of: aplasia of the septum pellucidum, of the corpus callosum and of the fornix, fusion of the subcortical ganglia and finally malformations of the face in the sense of cyclopia which are, however, not present in all cases. A description is given of a case of abortive arhinencephaly in a girl aged 22 months, who in the 6th month of life had suffered from a febrile affection with spasms (possibly encephalitis). At the age of 11 months she had developed spastic diplegia, which finally led to death with the picture of acute febrile bronchiolitis. Morbid-anatomical findings: fusion of the frontal two-fifths of the hemispheres, microgyria of the occipital and pachygryia of the frontal parts of the brain, an atypical course of the

Title : Experience in the Diagnosis of Malignant Tumors by Means
of Tubercle Bacilli. Preliminary Report.

Orig Pub : S'vrem. med., 1956, 7, № 12, 34-38

Abstract : Human tuberculosis bacteria fixed on a glass slide were put into a thermostat in a medium containing the blood of the patient under examination. After 10-12 days characteristic differences were found: in the blood of the cancer patients the colonies grew in small nests consisting of irregularly arranged bacteria; in the blood of healthy persons large colonies grew out, and the bacteria were arranged in parallel. The diagnosis of the disease established by means of this test differed from the clinical diagnosis in 8.4% of 134 cases.

TITLE: Bernoulli inequality

SOURCE: Fiziko-matematicheskoe spisanie, v. 8, no. 2, 1965, 115-120

TOPIC TAGS: Bernoulli equation, applied mathematics

16, 44, 55

ABSTRACT: The authors investigate the generalized Bernoulli equation

$$(1+x_1)(1+x_2)\dots(1+x_n) \geq 1+x_1+x_2+\dots+x_n \quad (5)$$

They show among others that 1) the inequality is satisfied in the $[x(y), y]$ interval and is not satisfied in any of its left expansions, i.e., in none of the intervals $[x', y]$ for which $x' < x(y)$ (everywhere $y \in (-1, 0)$); and 2) with n even, $n \geq 4$ the equality

$$x(y) = \xi_{n-1,y} \quad (16)$$

holds true and $x(y)$ is a rigorously increasing function ($\xi_{n-1,y}$ is a number < -2). Orig. art. has: 24 formulas. [JPRS]

"Silicones and Their Uses in Medicine"

Sofia, Svetska Meditsina, Vol 13, No 9, 1962; pp 35-39.

Abstract: Brief but wide-ranging review of uses of silicon compounds in medicine - their toxicity and possible occupational diseases in working with them; various uses in laboratory, instrumentation, surgery. In Bulgarian folk medicine, silicon-rich plants *Equisetum arvense* and *Herba galloptidis* are used against tuberculosis. 32 Western, 6 Soviet and 1 Polish reference.
